# Mitsubishi Electric Wire-cut EDM Systems

## MV2400R Machining Characteristics Data

### Notice

- ☐ An effort has been made to follow revisions in software and hardware for the details described in this Instruction Manual. However, there may be some cases that do not match.
- ☐ An effort has been made to make the details of this Instruction Manual complete. If any errors or points of notice are found, please contact Mitsubishi.
- ☐ This machining data has been created based on Mitsubishi-designated tests. The machining results may differ according to the various conditions such as electrode and workpiece material and shape, etc., being used. Performing test machining is recommended if further optimum machining is required.

| 3-1 | Machining with PM Control | ..... | A9  |
| 3-2 | Machining with CM control | ..... | A13 |
| 3-3 | Machining with RM Control | ..... | A17 |
| 3-4 | Machining with EM Control | ..... | A18 |
| 3-5 | Machining with OM control | ..... | A19 |
| 3-6 | Machining with BM control | ..... | A20 |

## 4. Optimizing Machining Conditions

|     |   |       |     |
|-----|---|-------|-----|
| 4-1 | 1st Cut Machining Section                       | ..... | A22 |
| 4-2 | Finish Machining Section                        | ..... | A23 |
| 4-3 | Nozzle Separated Machining Section              | ..... | A24 |
| 4-4 | Correcting the Upper/lower Dimension Difference | ..... | A25 |

## 5. Machining Characteristics Data

### 5-1 $\phi 0.20$ wire Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material      | Applicable mode                    | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|-------------------------|------------------------------------|-----------------------|---|
| $\phi 0.20$       | STEEL                   | Standard Punch(STDP1)              | 1                     | 5 to 100  |
|                   |                         | Standard Die(STDD1)                | 2                     | 5 to 100  |
|                   |                         | Nozzle Away Standard Punch(STDPO2) | 3                     | 5 to 60   |
|                   |                         | Nozzle Away Standard Die(STDDO2)   | 4                     | 5 to 60   |
|                   |                         | Accuracy Priority Punch(ACUP)      | 5                     | 5 to 100  |
|                   |                         | Accuracy Priority Die(ACUD)        | 6                     | 5 to 100  |
|                   |                         | Speed Priority(SPB)                | 7                     | 5 to 100  |
|                   | Tungsten Carbide(WC-Co) | Standard(STD)                      | 8                     | 5 to 100  |
|                   |                         | Minimum Step Punch(MSPP)           | 9                     | 10 to 60  |
|                   |                         | Minimum Step Punch(MSPD)           | 10                    | 10 to 30  |
|                   | Copper(Cu)              | Standard(STD)                      | 11                    | 5 to 100  |
|                   | Aluminum(Al)            |                                    | 12                    | 5 to 100  |
|                   | Graphite(Gr)            |                                    | 13                    | 10 to 100                                       |

\* 1

### 5-2 $\phi 0.25$ Wire Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material      | Applicable mode              | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|-------------------------|------------------------------|-----------------------|---|
| $\phi 0.25$       | STEEL                   | Standard-Punch(STDP1)        | 14                    | 5 to 100  |
|                   |                         | Standard-Die(STDD1)          | 15                    | 5 to 100  |
|                   |                         | Nozzle Away Standard(STDPO1) | 16                    | 5 to 150  |
|                   |                         | Accuracy Priority(ACU)       | 17                    | 5 to 300  |
|                   |                         | Speed Priority(SPB)          | 18                    | 5 to 100  |
|                   | Tungsten Carbide(WC-Co) | Standard(STD)                | 19                    | 5 to 100  |
|                   | Copper(Cu)              |                              | 20                    | 5 to 100  |
|                   | Aluminum(Al)            |                              | 21                    | 5 to 150  |
|                   | Graphite(Gr)            |                              | 22                    | 10 to 100                                       |

\* 1

### 5-3 $\phi 0.30$ Wire Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material | Applicable mode              | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|--------------------|------------------------------|-----------------------|---|
| $\phi 0.30$       | STEEL              | Standard(STD)                | 23                    | 5 to 300  |
|                   |                    | Nozzle Away Standard(STDPO1) | 24                    | 20 to 100                                       |
|                   | Aluminum(Al)       | Standard(STD)                | 25                    | 20 to 250                                       |
|                   | Copper(Cu)         |                              | 26                    | 20 to 100                                       |

### 5-4 $\phi 0.10$ Wire Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material      | Applicable mode              | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|-------------------------|------------------------------|-----------------------|---|
| $\phi 0.10$       | STEEL                   | Standard(STD)                | 27                    | 5 to 40   |
|                   |                         | Nozzle Away Standard(STDPO1) | 28                    | 5 to 10   |
|                   | Tungsten Carbide(WC-Co) | Standard(STD)                | 29                    | 5 to 40   |
|                   |                         | Nozzle Away Standard(STDPO1) | 30                    | 5 to 10   |
|                   | Copper(Cu)              | Standard(STD)                | 31                    | 5 to 20   |

### 5-5 $\phi 0.15$ Wire Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material      | Applicable mode              | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|-------------------------|------------------------------|-----------------------|---|
| $\phi 0.15$       | STEEL                   | Standard(STD)                | 32                    | 5 to 40   |
|                   |                         | Nozzle Away Standard(STDPO1) | 33                    | 5 to 10   |
|                   | Tungsten Carbide(WC-Co) | Standard(STD)                | 34                    | 5 to 40   |
|                   |                         | Nozzle Away Standard(STDPO1) | 35                    | 5 to 10   |

#### 5-6 Land Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material      | Applicable mode | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|-------------------------|-----------------|-----------------------|---|
| φ0.20             | STEEL                   | Land(LND)       | 36                    | 1 to 5  |
|                   | Tungsten Carbide(WC-Co) |                 | 37                    | 1 to 5  |
| φ0.25             | STEEL                   |                 | 38                    | 1 to 5  |
|                   | Tungsten Carbide(WC-Co) |                 | 39                    | 1 to 5  |

#### 5-7 PCD·CBN Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material | Applicable mode | Classification<br>No. | Machining conditions<br>Material thickness (mm) |     |
|-------------------|--------------------|-----------------|-----------------------|---|-----|
| φ0.20             | PCD                | Standard(STD)   | 40                    | 2 to 2  | * 2 |
|                   | CBN                |                 | 41                    | 2 to 2  | * 3 |
| φ0.25             | PCD                | Standard(STD)   | 42                    | 2 to 2  | * 2 |
|                   | CBN                |                 | 43                    | 2 to 2  | * 3 |

#### 5-8 SL Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material | Applicable mode  | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|--------------------|------------------|-----------------------|---|
| φ0.20             | STEEL              | SL Machining(SL) | 44                    | 5 to 100  |
| φ0.25             | STEEL              |                  | 45                    | 5 to 100  |

#### 5-9 Anglemaster Wide Angle Taper Specification (option.)

| Wire dia.<br>(mm) | Workpiece material | Applicable mode | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|--------------------|-----------------|-----------------------|---|
| φ0.20             | STEEL              | Standard(STD)   | 46                    | 20 to 40  |
| φ0.25             | STEEL              |                 | 47                    | 20 to 40  |

#### 5-10 φ0.07 Wire Machining characteristics data( option.)

| Wire dia.<br>(mm) | Workpiece material      | Applicable mode | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|-------------------------|-----------------|-----------------------|---|
| φ0.07             | STEEL                   | Standard(STD)   | 48                    | 5 to 20   |
|                   | Tungsten Carbide(WC-Co) | Standard(STD)   | 49                    | 5 to 20   |

#### 5-11 φ0.05 Wire Machining characteristics data(option.)

| Wire dia.<br>(mm) | Workpiece material      | Applicable mode | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|-------------------------|-----------------|-----------------------|---|
| φ0.05             | STEEL                   | Standard(STD)   | 50                    | 5 to 20   |
|                   | Tungsten Carbide(WC-Co) | Standard(STD)   | 51                    | 5 to 20   |

#### 5-12 Digital-FS Machining characteristics data(option.)

| Wire dia.<br>(mm) | Workpiece material      | Applicable mode | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|-------------------------|-----------------|-----------------------|---|
| φ0.20             | STEEL                   | Digital-FS(DFS) | 52                    | 5 to 80   |
|                   | Tungsten Carbide(WC-Co) |                 | 53                    | 5 to 80   |
| φ0.10             | STEEL                   |                 | 54                    | 5 to 40   |
|                   | Tungsten Carbide(WC-Co) |                 | 55                    | 5 to 40   |
| φ0.25             | STEEL                   |                 | 56                    | 5 to 100  |
|                   | Tungsten Carbide(WC-Co) |                 | 57                    | 5 to 100  |
| φ0.15             | STEEL                   |                 | 58                    | 5 to 40   |
|                   | Tungsten Carbide(WC-Co) |                 | 59                    | 5 to 40   |
| φ0.07             | STEEL                   |                 | 60                    | 5 to 20   |
|                   | Tungsten Carbide(WC-Co) |                 | 61                    | 5 to 20   |
| φ0.05             | STEEL                   |                 | 62                    | 5 to 20   |
|                   | Tungsten Carbide(WC-Co) |                 | 63                    | 5 to 20   |

#### 5-13 φ0.20 wire Machining characteristics data

| Wire dia.<br>(mm) | Workpiece material | Applicable mode          | Classification<br>No. | Machining conditions<br>Material thickness (mm) |
|-------------------|--------------------|--------------------------|-----------------------|---|
| φ0.20             | STEEL              | Minimum Step Punch(MSPP) | 64                    | 10 to 100                                       |

\*1: Graphite type 1 is a stabilizing condition.

Graphite type 2 and 3 are machining conditions which pursue machining speed.  
(Machining conditions are searched for type 1 only.)

\*2: For PCD, machining conditions are searched for type 1 (particle diameter 2 μm) only.  
For other particle diameter conditions, see the machining conditions table.

\*3: For CBN, machining conditions are searched for type 1 (particle diameter 10 μm) only.  
For other particle diameter conditions, see the machining conditions table.

\*4: Optional. See the machining conditions table.

# 1. Configuration of Machining Conditions Table

## 1-1 Configuration of Machining Conditions Table

|                  |                                    | Wire diameter |         |         |         |           |           |           |
|------------------|------------------------------------|---------------|---------|---------|---------|-----------|-----------|-----------|
|                  |                                    | φ0.05         | φ0.07   | φ0.10   | φ0.15   | φ0.20     | φ0.25     | φ0.30     |
| STEEL            | Standard Punch(STDP1)              | 5 to 20       | 5 to 20 | -       | -       | 5 to 100  | 5 to 100  | -         |
|                  | Standard Die(STDD1)                | -             | -       | -       | -       | 5 to 100  | 5 to 100  | -         |
|                  | Standard(STD)                      | -             | -       | -       | 5 to 40 | -         | -         | 5 to 300  |
|                  | Nozzle Away Standard Punch(STDPO2) | -             | -       | -       | -       | 5 to 60   | -         | -         |
|                  | Nozzle Away Standard Die(STDDO2)   | -             | -       | -       | -       | 5 to 60   | -         | -         |
|                  | Nozzle Away Standard (STDP01)      | -             | -       | 5 to 10 | 5 to 10 | -         | 5 to 150  | 20 to 100 |
|                  | Accuracy Priority Punch(ACUP)      | -             | -       | -       | -       | 5 to 100  | -         | -         |
|                  | Accuracy Priority Die(ACUD)        | -             | -       | -       | -       | 5 to 100  | -         | -         |
|                  | Accuracy Priority (ACU)            | -             | -       | -       | -       | -         | 5 to 300  | -         |
|                  | Speed Priority (SPB)               | -             | -       | -       | -       | 5 to 100  | 5 to 100  | -         |
|                  | Minimum Step Punch(MSPP)           | -             | -       | -       | -       | 10 to 100 | -         | -         |
|                  | Land Machining(LND)                | -             | -       | -       | -       | 1 to 5    | 1 to 5    | -         |
|                  | SL Machining(SL)                   | -             | -       | -       | -       | 5 to 100  | 5 to 100  | -         |
|                  | Anglemaster*1                      | -             | -       | -       | -       | 20 to 40  | 20 to 40  | -         |
|                  | Digital-FS(DFS)*2                  | 5 to 20       | 5 to 20 | 5 to 40 | 5 to 40 | 5 to 100  | 5 to 100  | -         |
| Tungsten Carbide | Standard (STD)                     | 5 to 20       | 5 to 20 | 5 to 40 | 5 to 40 | 5 to 100  | 5 to 100  | -         |
|                  | Minimum Step Punch(MSPP)           | -             | -       | -       | -       | 10 to 60  | -         | -         |
|                  | Minimum Step Die(MSPD)             | -             | -       | -       | -       | 10 to 30  | -         | -         |
|                  | Nozzle Away Standard (STDP01)      | -             | -       | 5 to 10 | 5 to 10 | -         | -         | -         |
|                  | Digital-FS(DFS)*2                  | 5 to 20       | 5 to 20 | 5 to 40 | -       | 5 to 80   | -         | -         |
| Copper           | Standard (STD)                     | -             | -       | 5 to 20 | -       | 5 to 100  | 5 to 100  | 20 to 100 |
| Aluminum         | Standard (STD)                     | -             | -       | -       | -       | 5 to 100  | 5 to 150  | 20 to 250 |
| Graphite         | Standard (STD)                     | -             | -       | -       | -       | 10 to 100 | 10 to 100 | -         |
| PCD              | Standard (STD)                     | -             | -       | -       | -       | 2 to 2    | 2 to 2    | -         |
| CBN              | Standard (STD)                     | -             | -       | -       | -       | 2 to 2    | 2 to 2    | -         |

\* The values in the table indicate the applicable plate thickness.

\* When selecting the conditions on the Automatic 2nd cut screen, each condition will appear as shown below.

- Standard-Punch.....STDP1
- Standard-Die.....STDD1
- Standard.....STD
- Nozzle Away Standard-Punch.....STDPO2
- Nozzle Away Standard-Die.....STDDO2
- Nozzle Away Standard.....STDP01
- Accuracy Priority-Punch.....ACUP
- Accuracy Priority-Die.....ACUD
- Accuracy Priority.....ACU
- Speed Priority.....SPB
- Land machining.....LND
- SL machining.....SL
- PCD.....PCD
- CBN.....CBN
- Minimum Step Punch.....MSPP
- Minimum Step Die.....MSPD
- Digital-FS.....DFS

\*1 Angle Taper is an option.

(Machining conditions cannot be searched. See the machining conditions table.)

\*2 Digital-FS is an option.(It is possible machining condition search ,but only applicabl for DFS option.)

## **1-2 Machining conditions**

- Standard conditions (STD•STDP1【Punch】•STDD1【Die】)  
These are the four to seven cut 3  $\mu\text{mRz}$  machining conditions.  
The 2nd and 3rd cut maintain the accuracy, and ultimately improve the surface roughness.
- Accuracy Priority Conditions (ACU•ACUP【Punch】•ACUD【Die】)  
These are the five or six cut 2  $\mu\text{mRz}$  machining conditions which prioritize shape accuracy and the effect of stress.  
Use these conditions when machining shapes with small corners or continuous corners, or when machining shapes which easily become distorted.
- Speed Priority Conditions (SPB)  
These machining conditions prioritize the machining speed. However, due to the susceptibility to the effects of stress, we recommend it for machining simple forms for small items.
- Nozzle Away Standard conditions (STDPO1•STDPO2【Punch】•STDDO2【Die】)  
These are the four cut 3  $\mu\text{mRz}$  machining conditions in Nozzle Away.  
The 2nd and 3rd cut maintain the accuracy, and ultimately improve the surface roughness.
- SL step conditions(SL)  
These machining conditions are used when machining a stepped workpiece.
- Land machining (LND)  
These are the Land machining conditions.
- Minimum Step(MSPP【Punch】•MSPD【Die】)  
These are the four cut 3  $\mu\text{mRz}$  machining conditions.  
The 2nd and 3rd cut maintain the accuracy, and ultimately improve the surface
- Digital-FS conditions (DFS)  
Use this when a fine surface roughness is required when using Digital-FS.

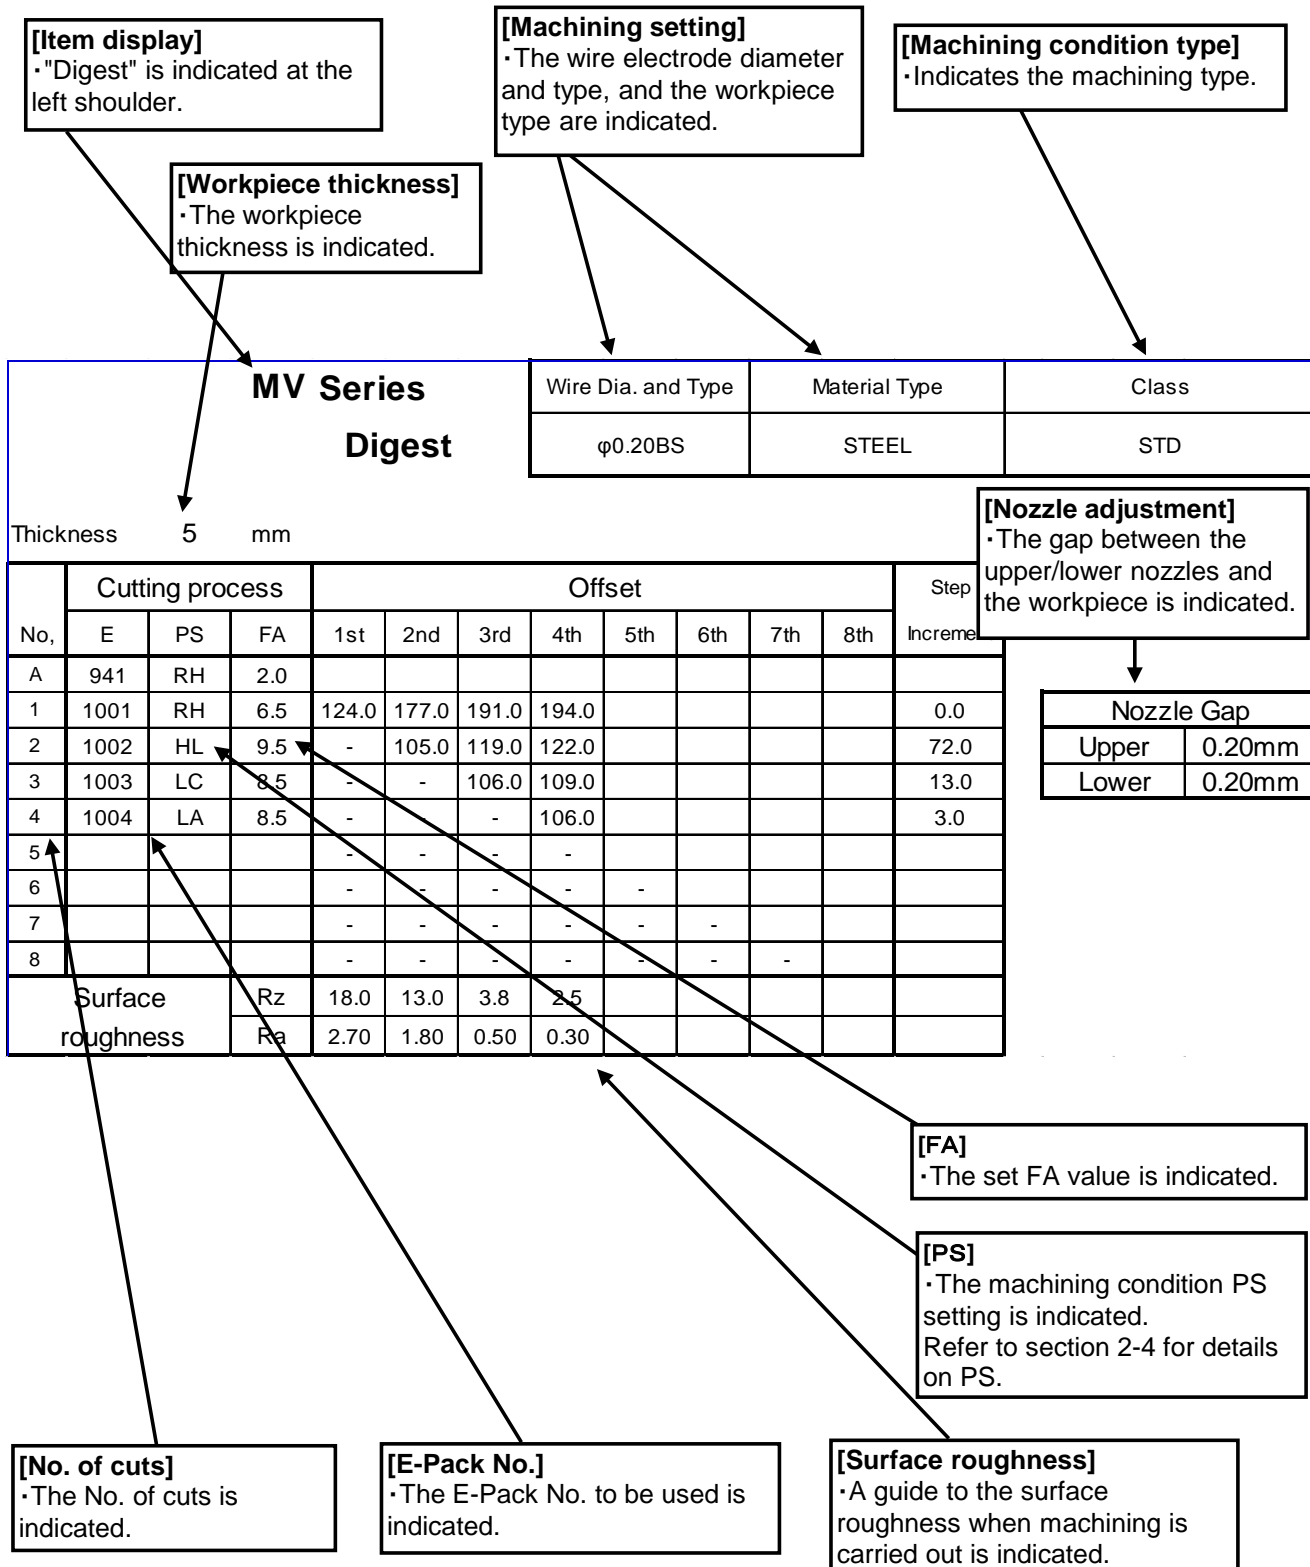

## 2. How to Read the Machining Characteristics Data Table

The machining characteristics data tables include the machining condition digest and machining conditions table.

The basic information required for machining, such as the E-Pack No. and FA, are written in the machining condition digest.

The detailed machining conditions are written in the machining conditions table.

### 2-1 How to Read the Machining Characteristics Data Table (Machining Condition Digest)

## 2-2 How to Read the Machining Characteristics Data Table (Machining Conditions Table)

### [Machining setting]

• The wire electrode diameter and type, workpiece type and thickness are indicated.

### [Item display]

• "Machining Data Sheet" is indicated at the centre.

### [Machining condition type]

• Indicates the machining type.

## MV Series Machning Data Sheet

| Wire Dia. and Type | Material Type | Material Thickness | Process | Nozzle Dia | Flush cup clearance |        |
|--------------------|---------------|--------------------|---------|------------|---------------------|--------|
|                    |               |                    |         |            | Upper               | Lower  |
| φ 0.20BS           | STEEL         | 5mm                | STD     | φ 4.0mm    | 0.20mm              | 0.20mm |

### [Nozzle Gap]

• The gap between the upper/lower nozzles and the workpiece is indicated.

| Cutting Process    | Start Up | Rough Cut             | Skim1                 | Skim2                 | Skim3                    | Skim4                    | Skim5 | Skim6 | Skim7 |
|--------------------|----------|-----------------------|-----------------------|-----------------------|--------------------------|--------------------------|-------|-------|-------|
| E-pack Number      | Eno      | 941                   | 1001                  | 1002                  | 1003                     | 1004                     |       |       |       |
| Power Supply       | PS       | RH                    | RH                    | HL                    | LC                       | LA                       |       |       |       |
| Servo              | SV       | NM                    | NM                    | NM                    | SL                       | SL                       |       |       |       |
| Voltage Open       | Vo       | 7                     | 7                     | 14                    | 12                       | 10                       |       |       |       |

| Rough & 7 Skims    | ----- |       |       |       |       |       |       |       | ----- |
| Stepping Increment | ----- | ----- | 72.0  | 13.0  | 3.0   |       |       |       |       |

### [Display Speed]

• Indicates the machining speed used as a guide during machining.  
• The average machining voltage is adjusted to near this value.

| RESULTS              |     |  |             |             |             |             |  |  |  |
|----------------------|-----|--|-------------|-------------|-------------|-------------|--|--|--|
| Feedrate Cutting     | FC  |  | 9.0 ~ 11.0  | 18.2 ~ 22.2 | 7.7 ~ 8.6   | 7.7 ~ 8.6   |  |  |  |
| Average Voltage Gap  | V   |  | 47 ~ 59     | 92 ~ 105    | 154 ~ 166   | 121 ~ 132   |  |  |  |
| Avg. Linear Feedrate | ALF |  | 600.0       | 401.3       | 220.4       | 151.9       |  |  |  |
| Surface Finish(u m)  | Ry  |  | 16.2 ~ 19.8 | 11.7 ~ 14.3 | 3.4 ~ 4.2   | 2.2 ~ 2.8   |  |  |  |
|                      | Ra  |  | 2.43 ~ 2.97 | 1.62 ~ 1.96 | 0.45 ~ 0.55 | 0.27 ~ 0.33 |  |  |  |

### [Average Machining Voltage]

• Indicates the machining voltage used as a guide during machining.

### [Surface Roughness]

• Indicates a guide to the surface roughness when machining is executed.

Note: Set flush cup clearance as shown as Top chart.

Note: Please use the straightness compensation function.

(If wire breakage occurs, set FA Adjust to -1 or -2 on monitor screen.)

Version1.1

1- 1

### [Machining conditions table version]

• The machining conditions table version is indicated.

## 2-3 Names of Machining Conditions Setting Notches

|   |            |  |
|---|------------|--|
| E-Pack Number                             | <b>Eno</b> |  |
| Power Selection                           | <b>PS</b>  | .... This switch sets the power supply mode.   |
| Servo                                     | <b>SV</b>  | .... This switch sets the servo mode.  |
| Voltage Open                              | <b>Vo</b>  | .... This switch sets the height of the gap voltage during no-load.  |
| Power Setting                             | <b>IP</b>  | .... This switch sets the size of the peak current that flows the gap.                                       |
| IP Adjustment                             | <b>ΔIP</b> | .... This switch finely adjusts the size of the peak current that flows the gap.                             |
| Off Time                                  | <b>OFF</b> | .... This switch sets the time from when the discharge is completed to when the voltage is applied again.    |
| Stabilizer A                              | <b>SA</b>  | .... This switch determines the machining stability, and is used to finely adjust the current.               |
| Stabilizer B                              | <b>SB</b>  | .... This switch determines the machining stability, and is used to finely adjust the off time.              |
| Stabilizer C                              | <b>SC</b>  | .... This switch is used to stabilize machining during rough machining.                                      |
| Stabilizer E                              | <b>SE</b>  | .... This switch sets the machining stability, and is used particularly for 1st cut machining.               |
| Voltage Gap<br>(Voltage adjustment width) | <b>VG</b>  | .... This switch sets the average machining voltage used as a target value when machining with optimum feed. |
| Fine Machining                            | <b>FM</b>  | .... This switch sets the fine machining mode to ON or OFF.  |
| Digital-AE                                | <b>DAE</b> | .... This switch sets the fine DAE mode to ON or OFF.  |
| Wire Speed                                | <b>WS</b>  | .... This switch sets the wire feedrate.   |
| Wire Tension                              | <b>WT</b>  | .... This switch sets the wire tension.  |
| Pre-Tension                               | <b>PT</b>  | .... This switch sets the wire pretension.   |
| Flow Balance                              | <b>FB</b>  | .... This switch sets the flow balance of the dielectric fluid.  |
| Liquid Quantity                           | <b>LQ</b>  | .... This switch sets the dielectric fluid flow rate.  |
| Liquid Resistivity                        | <b>LR</b>  | .... This switch sets the specific resistivity of the dielectric fluid.                                      |
| Straightness Compensation                 | <b>CC</b>  | .... This switch sets the straightness compensation.   |
| Feedrate Address                          | <b>FA</b>  | .... The setting machining speed required for machining.   |
| Flow Rate (Upper side)                    |            | .... Reference value of dielectric fluid flow rate from upper nozzle.  |
| Flow Rate (Lower side)                    |            | .... Reference value of dielectric fluid flow rate from lower nozzle.  |

|                |   |
|----------------|---|
| Step Increment | .... Offset stepping increment for 1st to 2nd, 2nd to 3rd, etc. |
|----------------|---|

|                           |            |  |
|---------------------------|------------|--|
| Feedrate Cutting (mm/min) | <b>FC</b>  | .... Reference value of the actual machining speed during machining.                                     |
| Average Voltage Gap       | <b>V</b>   | .... Reference value of the actual machining voltage during machining.                                   |
| Average machining speed   | <b>ALF</b> | .... This is a guide to the machining speed for estimating the machining. (Machining distance per hour.) |
| Surface Roughness (μm)    | <b>Rz</b>  | .... Reference value of the machining surface roughness. Unit: μmRz                                      |
|                           | <b>Ra</b>  | .... Reference value of the machining surface roughness. Unit: μmRa                                      |

## 2-4 Notch Settings

|                      |  |
|----------------------|--|
| PS : Power Selection | <p>This switch is used to set the power supply mode. There are 9 types, RH,RL,KH,KL,MP,HL,LA,LB,LC.</p> <p>RH, RL, KH, and KL are the rough machining and medium finish machining power supply modes, and are valid at the IP4 to 16 notches. MP and HL are the rough machining and medium finish machining power supply modes, and are valid at the IP4 to 29 notches.</p> <p>LA,LB and LC are the finish machining power supply mode, and is valid at the IP1 to 3 notches.</p>  |
| SV : Servo           | <p>There are three types of switches, NM,SL , used to set the servo mode.</p> <p>NM is mainly used for the rough machining or medium finish machining, and SL are used for finish machining.</p>   |
| Vo : Voltage Open    | <p>Switch to set the height of the gap voltage when no load is applied. Notch has 16 stages (1 to 16). Voltage increases for larger notch number.</p> <p>Use ▲ or ▼ to increase or decrease notch level.</p>   |
| IP : Power Setting   | <p>Switch to set the size of the peak current that flows the gap. Notch has 16 stages (1 to 16). Notches 1 to 3 are for finishing circuit. The range that can be set differs according to the power selection (PS). Refer to the section on PS for details.</p> <p>Current is larger for larger notch numbers and machining speed increases proportionately. Conversely, surface roughness, clearance, etc. increase. Wire breakage occurs frequently if power setting is very high. Power must be set to commensurate with workpiece materials and wire electrode.</p> <p>Use ▲ or ▼ to increase or decrease notch level.</p> |
| ΔIP : IP Adjustment  | <p>Switch to finely adjust the size of the peak current that flows the gap. Notch has 16 stages (1 to 16).</p> <p>The adjusted current will increase when a larger notch number is set, so the machining speed will increase. Conversely, the surface roughness and clearance, etc., will increase. If the power setting is too large, the wire will break easily. This must be set according to the workpiece materials and wire electrode.</p> <p>Use ▲ or ▼ to increase or decrease notch level.</p>  |
| OFF : Off Time       | <p>Switch to set time between end of discharge and application of voltage. When power mode is KH or KL, notch has 1 or 2 notches, and when RH or RL has 20 stages (1 to 20) and LC has 16 stages (1 to 16). The off time shortens when a smaller notch is set, and the machining speed increases in proportion. However, the machining will be unstable, resulting in wire breakage or short-circuits.</p> <p>Use ▲ or ▼ to increase or decrease notch level.</p>  |
| SA : Stabilizer A    | <p>Switch to stabilize the machining state. Notch has 10 stages (1 to 10). The higher the value is, the faster the machining speed will be. However, if too high, wire breakage will occur. Thus, set this according to the wire diameter. The smaller the diameter is, the smaller the setting must be.</p> <p>Use ▲ or ▼ to increase or decrease notch level.</p>  |
| SB : Stabilizer B    | <p>Switch to make the machining more stable. Notch has 20 stages (1 to 20). The higher the value is, the slower the machining speed will be. This must be set according to the material of the workpiece.</p> <p>Use ▲ or ▼ to increase or decrease notch level.</p>   |
| SC : Stabilizer C    | <p>Switch to stabilize machining for finishing circuit. Notch has 7 stages (1 to 7).</p> <p>Use ▲ or ▼ to increase or decrease notch level.</p>  |
| SE : Stabilizer E    | <p>Switch used particularly for 1st cut machining. Notch has 5 stages (1 to 5). Notch 1 is OFF, and notches 2 to 5 are ON. As the value increases (2 → 3 → 4 → 5), the machining speed become slower, but wire will not break as easily.</p> <p>Use ▲ or ▼ to increase or decrease notch level.</p>  |

|                         |   |
|-------------------------|---|
| VG : Voltage Gap        | Switch to set average machining voltage used as a target value to machine with optimum feed. The setting range is 1 to 400.<br>Use ▲ or ▼ to increase or decrease notch level.  |
| FM : Fine Machining     | Switch to set fine machining mode ON or OFF. Switch includes the ON and OFF setting. Set this to ON to attain a minute surface roughness using the PF circuit, and set to OFF when not using this function.<br>This switch can be set to ON when the power selection (PS) is LC.  |
| DAE : Digital AE        | Switch to set the Digital-AE mode ON or OFF. Switch includes the ON and OFF setting. Set this to ON to use the Digital-AE power supply, and OFF when not using this function.   |
| WS : Wire Speed         | Switch to set the wire feedrate. Notch has 18 stages (1 to 18). The higher the value is, the faster the wire feedrate will be.<br>When the machining with the wire processing unit(Optional), please use 9 or more than 9 for WS notch. In case of lower setting than 8, it may cause the wire jamming.                   |
| WT : Wire Tension       | Switch to set the wire tension. Notch has 16 stages (1 to 16). The higher the value is, the stronger the tension will be.<br>Please use WT1~2 only on fine wire specification machine.<br>Use ▲ or ▼ to increase or decrease notch level.   |
| PT : Pre-Tension        | Switch to set the wire pretension. Notch has 16 stages (1 to 16). The higher the value is, the stronger the tension will be.<br>Use ▲ or ▼ to increase or decrease notch level.   |
| FB : Flow Balance       | This switch is used to set the balance of the dielectric fluid discharged from the upper and lower dielectric fluid nozzles. NM, U or L can be selected.<br>Normally, NM is used. Select U to lower the upper nozzle flow rate, L to lower the lower nozzle flow rate.  |
| LQ : Liquid Quantity    | Switch to set dielectric fluid flow rate. Notch has 16 states (1 to 16). The dielectric fluid flow rate will increase as the No. increases. Using the "strong" and "weak" switches on the machine operation panel will set "strong" to notch 14 and "weak" to notch 4.<br>Use ▲ or ▼ to increase or decrease notch level. |
| LR : Liquid Resistivity | Switch to set specific resistivity of dielectric fluid. Notch has 10 stages (1 to 10). The higher the value is, the lower the specific resistivity will be. 1 indicates that the pump is always ON.<br>Use ▲ or ▼ to increase or decrease notch level.  |

## 2-5 Setting the Nozzle and Dielectric Fluid Flow Rate

### 2-5-1 Installing the workpiece

#### Upper clearance setting

Set as follows:  
Standard Accuracy and Accuracy Priority  
conditions: 0.20 mm

#### Lower clearance setting

Set 0.20 mm.

### 2-5-2 Checking the dielectric fluid flow rate

The reference dielectric fluid flow rates for each LQ notch setting are shown below.

(When using  $\varnothing 4.0$  nozzle cap)

Check with water filled up to the upper nozzle with no workpiece set. (Carry out with Z set to 40mm.)

Check the dielectric fluid flow rate with the dielectric fluid flow meter displayed on the MONITOR screen. (See following drawing.)

If the flow rate greatly differs from the values below, contact the service personnel and have the level readjusted.

| LQ notch | Flow rate (L/min) |           |
|----------|-------------------|-----------|
| 1        | 0.0               |           |
| 2        | 0.4               | $\pm 0.3$ |
| 3        | 1.0               | $\pm 0.5$ |
| 4        | 1.4               | $\pm 0.5$ |
| 5        | 1.8               | $\pm 0.5$ |
| 6        | 2.6               | $\pm 0.5$ |
| 7        | 3.4               | $\pm 1.0$ |
| 8        | 4.4               | $\pm 1.0$ |
| 9        | 5.0               | $\pm 1.0$ |
| 10       | 5.8               | $\pm 1.0$ |
| 11       | 7.5               | $\pm 1.0$ |
| 12       | 9.4               | $\pm 1.0$ |
| 13       | 10.0              | or more   |
| 14       | 10.0              | or more   |
| 15       | 10.0              | or more   |
| 16       | 10.0              | or more   |

### **3. Adaptive Control**

Adaptive control is a technology that significantly combines the optimum processes for various machining patterns including complex shape workpiece machining, nozzle separated machining and corner machining.

Adaptive control is configured of the following functions.

**(1) PM control**

Function that prevents wire breakage and controls the machining energy to the optimum state during rough machining.

**(2) CM control**

Function that prevents "corner sagging" and "gouging" that occur at the corner section.

**(3) EM control**

Function that reduces extremely small cavities (often called "dimples") that form at the point (approach point) where machined die shape connects to the approach machining path from the machining start hole.

**(4) OM control**

Function that reduces the shape dimension error at the arc section and linear section.

**(5) BM control**

This function prevents the "notches" and "cracks" that form when machining CBN or PCD material, etc.

**(6) RM control**

"RM" (rough master) is a control function that attempts to prevent corner breakages occurring in rough machining.

**\*The RM switch is constantly kept ON.**

#### **3-1 Machining with PM Control**

##### **3-1-1 What is PM control?**

This is an adaptive control function that prevents wire breakage and controls the machining energy to be optimal during rough machining (during first cut).

**(1) Automatic setting of machining conditions**

The machining conditions are automatically generated when the diameter and material of the wire to be used, the workpiece material and the PM mode are selected. Thus, operations such as selection of the E-Pack conditions per plate thickness and setting of the approach machining conditions are not required.

**(2) Setting of mode to match machining pattern**

The nozzle release, nozzle contact, thin plate and 3D-PM machining modes are prepared to be used according to the machining pattern such as the workpiece shape and setup environment.

**(3) Automatic plate thickness detection (When using nozzle release and thin plate modes)**

The workpiece plate thickness is automatically detected and the machining energy is optimally controlled for each plate thickness. Complicated programming to change the machining conditions according to the changes in the plate thickness is no longer required.

**(4) Wire breakage prevention function**

Breakage of the wire is prevented even during approach machining or stepped machining, and the machining energy is optimally controlled.

**(5) 3D-PM**

Changes in the shape caused by the progress of machining are predicted with an NC program and 3D model using the 1st conditions to provide special control corresponding to the shape. Refer to Chapter 3 of this Instruction Manual for details.

##### **3-1-2 Setting PM control**

PM control is automatically set to the optimum conditions by setting [WORKPIECE THICKNESS CHANGE AMOUNT] on the Automatic 2nd cut screen. This can also be set manually on the "Adaptive Control" screen under the Automatic 2nd cut screen or "Monitor" screen. (The automatically set items can also be confirmed on this screen.)

Refer to "NC OPERATION DISPLAY SCREEN" in the Instruction Manual for details on automatic setting.

### 3-1-3 Applicable ranges of PM control

(1) Wire type and workpiece material

Use the following wire types and workpiece materials during PM control.

Wire types : BS wire ( $\phi 0.2$  to  $\phi 0.3$ )

\* Always use the Mitsubishi-recommended wire.

Workpiece materials : Steel, Tungsten Carbide, Copper, Aluminum

\* 3D-PM is compatible only with steel.

(2) Workpiece plate thickness and taper angle

Always use PM control within the following ranges.

|                |                 | $\phi 0.20$ | $\phi 0.25$                | $\phi 0.30$                |
|----------------|-----------------|-------------|----------------------------|----------------------------|
| Nozzle release | Plate thickness | 5 to 100 mm | 5 to 250 mm                | 20 to 250 mm               |
|                | Taper angle     | 0 to 15°    | 0 to 15°<br>(Up to 100 mm) | 0 to 15°<br>(Up to 100 mm) |
| Nozzle contact | Plate thickness | 5 to 100 mm | 5 to 250 mm                | 20 to 250 mm               |
|                | Taper angle     | 0 to 15°    | 0 to 15°<br>(Up to 100 mm) | 0 to 15°<br>(Up to 100 mm) |
| Thin plate     | Plate thickness | 1 to 25 mm  | 1 to 25mm                  |                            |
|                | Taper angle     | 0 to 15°    | 0 to 15°                   |                            |
| 3D-PM          | Plate thickness | 1 to 100 mm | 1 to 150 mm                |                            |
|                | Taper angle     |             |                            |                            |

### 3-1-4 PM control with wide angle taper specifications (option)

When using PM control with the wide angle taper specifications nozzle, the fluid pressure supplied between the machining pieces will drop compared to when machining with the standard nozzle. Thus, even when the nozzle and workpiece contact, only the same fluid pressure as the nozzle release state will be achieved, so use the nozzle release mode in addition to inputting the maximum taper angle.

**NOTE**

☐ If PM control is used for machining only for machining the taper angle 0 degree, the fluid pressure supplied between the machining pieces will drop, so do not use the wide angle taper specifications.

**NOTE**

- (1) The application range above may be expanded in the future. When expanded, the application range will be listed in the "Supplement" for the system software, so please refer to that document.
- (2) The above applicable ranges are for submerged machining. When carrying out non-submerged machining with the <Submersible machine>, the effect of PM control will drop, so always use this control with submerged machining.
- (3) PM control is applicable only to the 1st cut conditions.  
PM control turns OFF automatically when the E command in the program is the for the 2nd and following cut. (The PM mode will not change.) However, the PM control will not turn OFF even if the E-Pack for the 2nd or following cut is selected from the screen.
- (4) PM control cannot be used with the cost save mode.
- (5) The workpiece thickness and taper angle that can be machined are limited by the UV axis stroke.  
(The maximum taper angle is 15° for a thickness of 100 mm.)
- (6) When machining from the edge, etc., the fluid supplied to the machining member could drop and the wire could break as compared to when machining inside the workpiece. In this case, adjust the machining speed to the minus side until the machining stabilizes, or lengthen the approach machining distance. Refer to "NC Operation Display Screen" for details.

### 3-1-5 PM mode

#### (1) PM mode selection

Select the PM control machining mode according to the workpiece shape or setup environment.

##### a) Nozzle release mode

This mode is used when machining workpieces that have changes in the plate thickness (minimum plate thickness is 5 mm or more \*1), such as hollow shapes like pipes or stepped workpieces. This mode is effective when the state of the dielectric fluid is poor such as when biting from the workpiece edges occurs.

In the nozzle release mode, the workpiece plate thickness is automatically detected and the machining conditions are optimally controlled. In places where application of the dielectric fluid is poor, the machining energy is accurately controlled to prevent wire breakage.

\*1: Minimum plate thickness 20 mm or more for  $\phi 0.30$  wire diameter

##### b) Nozzle contact mode

This mode is used when machining plate-shaped workpieces that have no change in the plate thickness and are 5mm or more thicker (\*1).

In the nozzle contact mode, contact the dielectric fluid nozzle against the workpiece. (\*2)

\*1: Minimum plate thickness 20 mm or more for  $\phi 0.30$  wire diameter

\*2: Nozzle is 0.15 mm or less from the workpiece.

\*3: If the nozzle contact mode is selected, the workpiece plate thickness must be set in addition to the wire type and workpiece material.

##### c) Thin plate mode

This mode is used when machining thin workpieces that have changes in the plate thickness of 5mm or less (\*1), or when the state of the dielectric fluid is poor such as when the dielectric fluid nozzle cannot be contacted against the workpiece.

The workpiece plate thickness is automatically detected and the machining conditions are optimally controlled even in the thin plate mode.

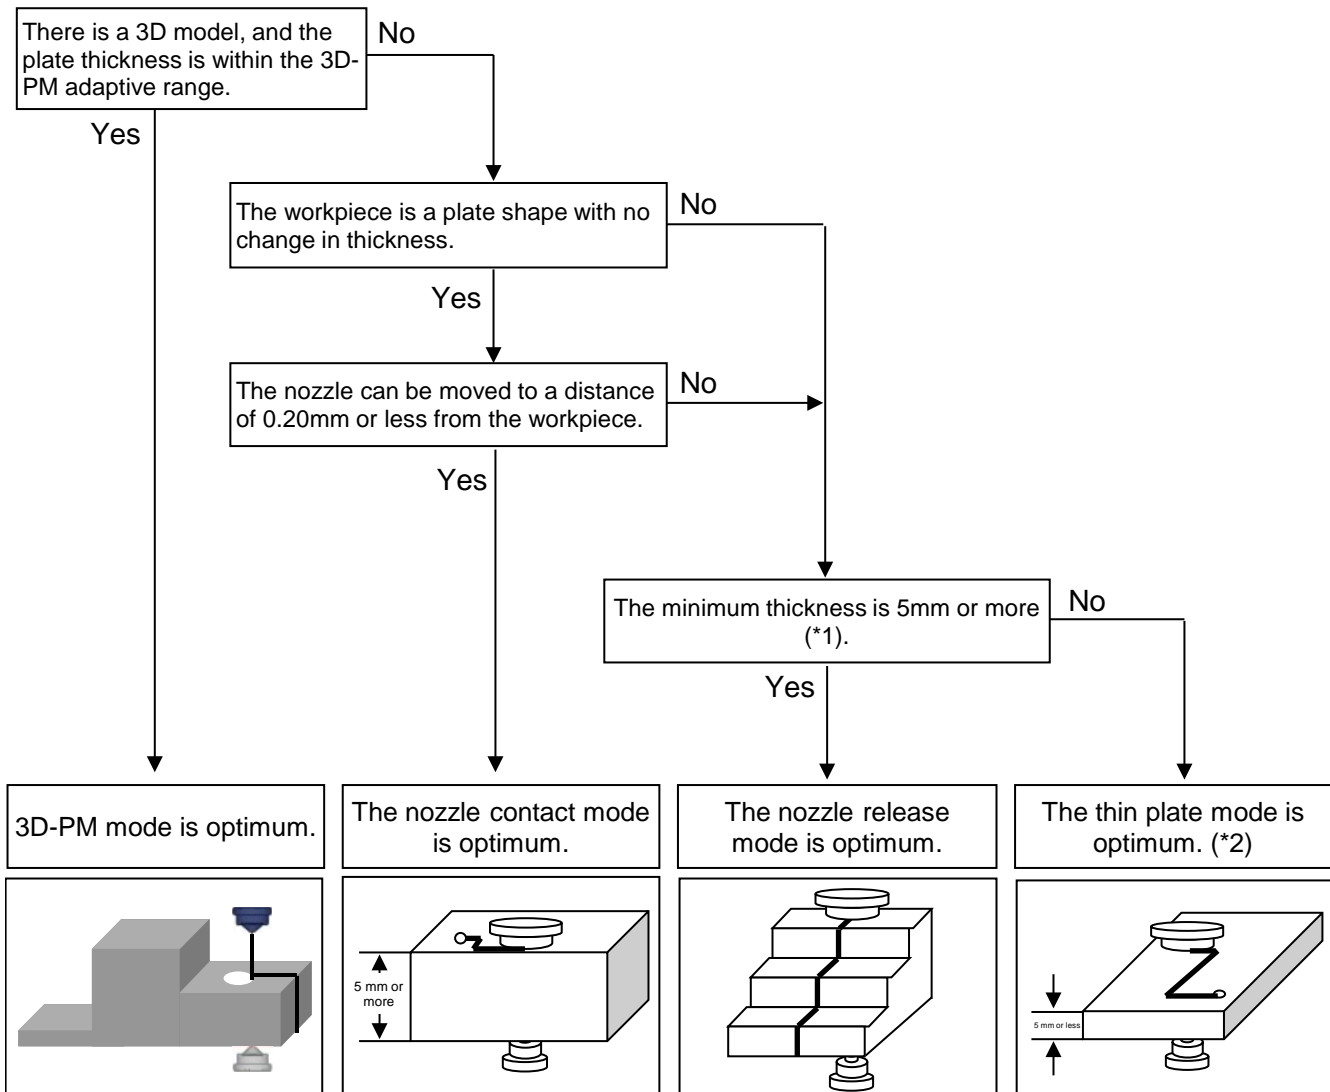

\*1: The thin plate mode cannot be used when using a  $\phi 0.30$  wire.

##### d) 3D-PM mode

This mode is used when there is a 3D model. This mode is effective when machining a workpiece with tap holes or large steps in the path and in which short circuits or wire breakages occur frequently.

## (2) PM mode selection

\*1: Minimum plate thickness 20 mm or more for  $\varnothing 0.30$  wire diameter

\*2: The thin plate mode cannot be used when using a  $\varnothing 0.30$  wire.

\*3: Refer to Chapter 3 of this Instruction Manual for details.

## 3-2 Machining with CM control

CM control is a function that prevents "corner drooping" and "gouging". The "CM-R (corner master R)" used for the first cut, and "CM-S (corner master S)" used for the 2nd and following cuts settings are available.

The MV Series machining conditions are configured on the premise that corner control will be used. Always use corner control particularly when machining small corners. We recommend using it with CM-R ON, and CM-S ON.

### (1) Setting CM-R

CM-R is corner control for rough machining.

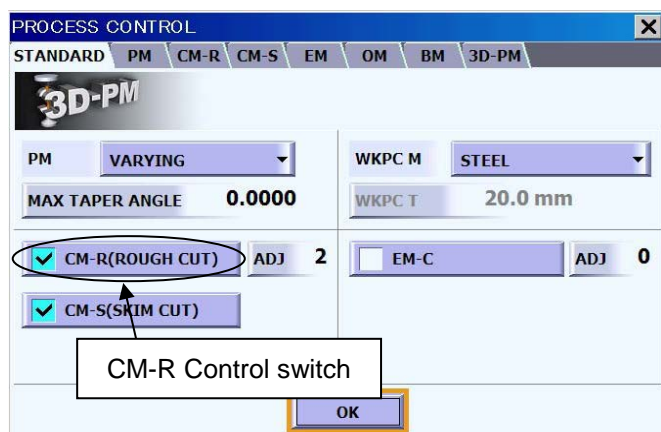

"CM-R" is a function that prevents corner drooping during the 1st cut. This control can be used only in the following cases.

- When the "CM-R (Rough cut)" switch is ON, this function is effective only for the 1st cut conditions in the standard E-Pack supplied from Mitsubishi.
- This function can be used only in the offset mode.

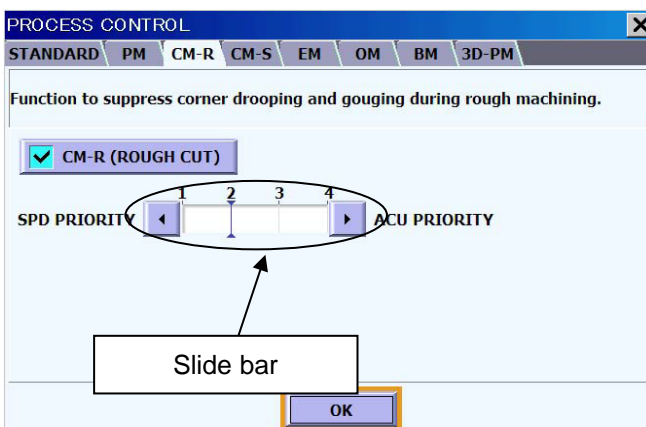

### [Usage Methods]

The control is turned ON and OFF with the switches on the "Process Control" screen. Use the slide bar (see following drawing) on the Process Control screen to adjust the degree of the control. The corner control intensifies when the bar is set to the right, but the machining speed at the corner section will drop. The left end is the 1 notch, and the right end is the 4 notch.

Process Control (Standard screen)

Process Control (Detail screen)

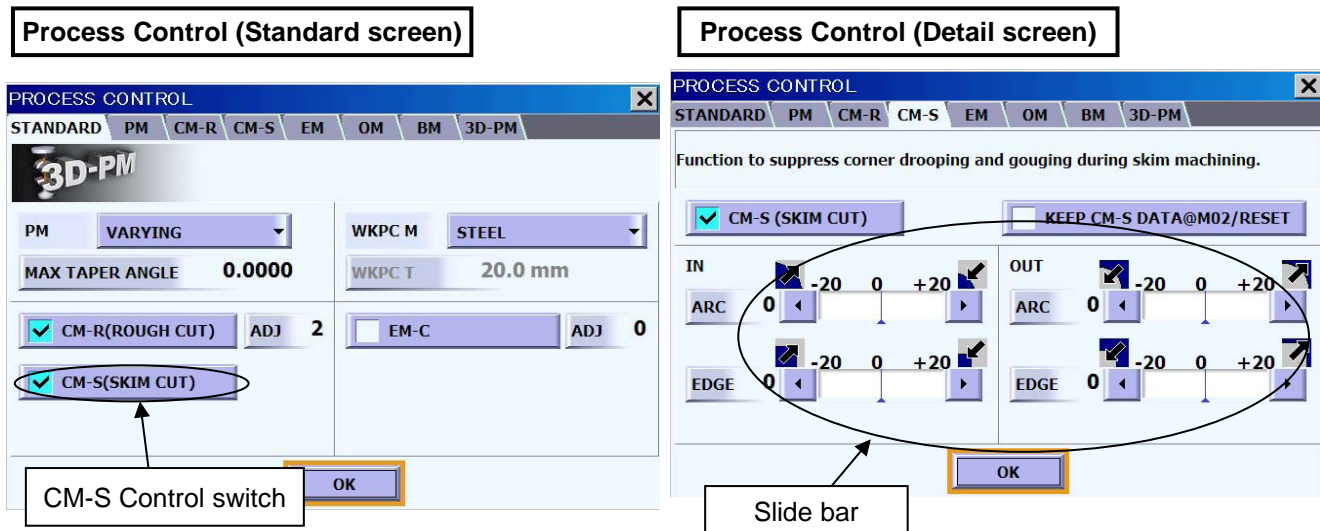

## (2)Setting CM-S

"CM-S" is a function that prevents corner drooping and gouging during the 2nd and following cuts. The speed corresponding to each corner is set automatically.

### [Usage methods (Standard)]

The control is turned ON and OFF with the switches on the "Process Control" screen.  
The degree of the control is set with the slide bar on the Detail screen.

### [Adjusting the slide bar]

#### ■ [CM-S IN ARC]

Set this to improve the accuracy at the arc corner of an in corner.

To the "-" side if the machining amount at the arc corner section of an in corner is "insufficient"

To the "+" side if the machining amount at the arc corner section of an in corner section is "excessive"

#### ■ [CM-S IN EDGE]

Set this to improve the accuracy at the linear corner of an in corner.

To the "-" side if the machining amount at the linear corner section of an in corner is "insufficient"

To the "+" side if the machining amount at the linear corner section of an in corner section is "excessive"

#### ■ [CM-S OUT ARC]

Set this to improve the accuracy at the arc corner of an out corner.

To the "-" side if the machining amount at the arc corner section of an out corner is "insufficient"

To the "+" side if the machining amount at the arc corner section of an out corner section is "excessive"

#### ■ [CM-S OUT EDGE]

Set this to improve the accuracy at the linear corner of an out corner.

To the "-" side if the machining amount at the linear corner section of an out corner is "insufficient"

To the "+" side if the machining amount at the linear corner section of an out corner section is "excessive"

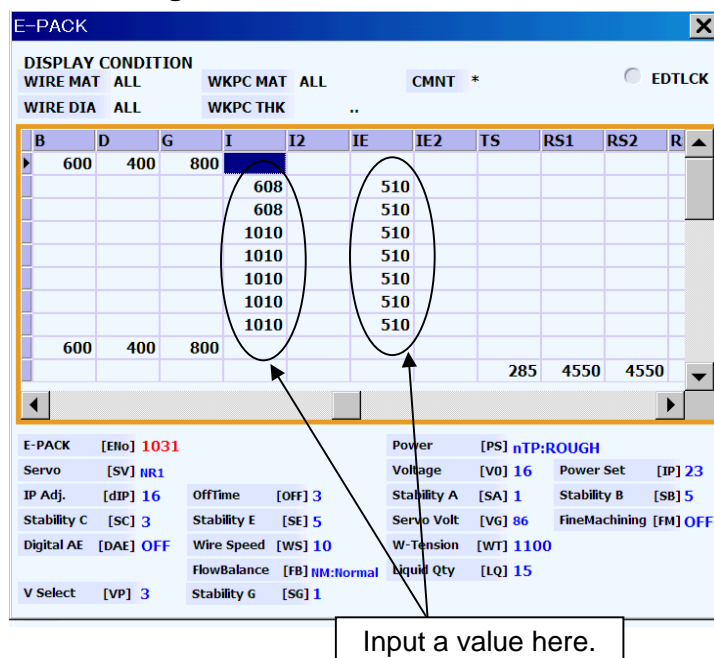

## [Usage methods (Applied) CM-S2]

The degree of the control can be individually adjusted for each E-Pack using the infometer "I" and "IE" in the E-Pack.

I : Parameter which adjusts corner shape.

IE: Parameter which adjusts shape of sharp edge.

### Screen listing E-Pack

Operating points of "I" and "IE" of CM-S"

|    | Control corner R value |          |
|----|------------------------|----------|
|    | In R                   | Out R    |
| I  | 0.0001mm               | 0.0001mm |
| I2 | 1mm                    | 1mm      |

|     | Control open angle value |          |
|-----|--------------------------|----------|
|     | In Edge                  | Out Edge |
| IE  | 90°                      | 90°      |
| IE2 | 165°                     | 165°     |

Four digits are input. The first two digits are the setting coefficient for the in corner, and the last two digits are the setting coefficient for the outer corner.

The setting coefficient can be input in the range of 1 to 99.

The basic value is "1010".

\*1: If no data is input, control will be applied with "1010".

\*2: If IE is not input, IE is controlled with I value.

Infometer "I" ... 00 00

↑ Out corner  
↑  
In corner

Relation of setting coefficient and speed

|            | 1          | Setting coefficient | 99         |
|------------|------------|---------------------|------------|
| In corner  | Speed slow | ←→                  | Speed fast |
| Out corner | Speed slow | ←→                  | Speed fast |

In respect to the in corner, the speed should be slow to avoid contact and to correct the shape. Thus, generally a small value is set. It is also common to set a small value in the same manner when the corner R is small.

In respect to the out corner, the speed should be increased to correct the shape. Thus, a large value is generally set. If the corner R is small, the value may be set smaller in some cases.

## [Usage methods (Applied) CM-S3]

The degree of the control can be individually adjusted for each E-Pack using the infometer "RS1~6" and "ES1~6" in the E-Pack. CM-S3 control range can be adjusted in more detail than CM-2 control.

\*1: This is the E-Pack for finish machining which 42~59 values are input in "Classification C" (Machining class).

"RS1~6" are parameters that adjust the corner shape. The tilt can be adjusted in the intervals that are set by RS 1~6.

"ES1~6" are parameters that adjust the shape at edge corner. ES1~6S setting can be adjusted in the intervals that are set by ES1~6S.

## Screen listing E-Pack

The screenshot shows the E-Pack control interface with the following parameters and values:

| IE2 | TS  | RS1  | RS2  | RS3  | RS4  | RS5  | RS6  | ES1  | ES2 | ES3 | ES4 | ES5 | ES6 |
|-----|-----|------|------|------|------|------|------|------|-----|-----|-----|-----|-----|
|     | 285 | 4550 | 4550 | 4550 | 4550 | 5050 | 5050 | 4040 |     |     |     |     |     |
|     | 90  | 3550 | 4050 | 4550 | 4550 | 5050 | 5050 | 4040 |     |     |     |     |     |
|     | 75  | 3550 | 4550 | 4550 | 4550 | 5050 | 5050 | 5040 |     |     |     |     |     |
|     | 50  | 4550 | 4550 | 4550 | 4550 | 5050 | 5050 | 5040 |     |     |     |     |     |
|     | 30  | 4550 | 4550 | 4550 | 4550 | 5050 | 5050 | 5040 |     |     |     |     |     |
|     | 30  | 5050 | 5050 | 5050 | 5050 | 5050 | 5050 | 5040 |     |     |     |     |     |
|     | 20  | 5050 | 5050 | 5050 | 5050 | 5050 | 5050 | 5040 |     |     |     |     |     |
|     | 285 | 4550 | 4550 | 4550 | 4550 | 5050 | 5050 | 4040 |     |     |     |     |     |

Below the table, there are various control parameters and their values:

- E-PACK [Elo] 1041
- Servo [SV] NR1
- IP Adj. [dIP] 16
- Stability C [SC] 3
- Digital AE [DAE] OFF
- V Select [VP] 3
- OffTime [OFF] 3
- Stability E [SE] 5
- Wire Speed [WS] 10
- FlowBalance [FB] 1
- Stability G [SG] 1
- Power [PS] nTP:ROUGH
- Voltage [V0] 16
- Stability A [SA] 1
- Servo Volt [VG] 86
- W-Tension [WT] 1100
- Power Set [IP] 23
- Stability B [SB] 5
- FineMachining [FM] OFF

An arrow points to the "Input a value here." text box.

Operating points of "RS" and "ES" of CM-S3

|     | Control corner R value |          |
|-----|------------------------|----------|
|     | In R                   | Out R    |
| RS1 | 0.0001mm               | 0.0001mm |
| RS2 | 0.03mm                 | 0.1mm    |
| RS3 | 0.06mm                 | 0.2mm    |
| RS4 | 0.15mm                 | 0.4mm    |
| RS5 | 0.5mm                  | 0.6mm    |
| RS6 | 1mm                    | 1mm      |

|     | Control open angle value |          |
|-----|--------------------------|----------|
|     | In Edge                  | Out Edge |
| ES1 | 90°                      | 90°      |
| ES2 | 105°                     | 105°     |
| ES3 | 120°                     | 120°     |
| ES4 | 135°                     | 135°     |
| ES5 | 150°                     | 150°     |
| ES6 | 165°                     | 165°     |

Four digits are input. The first two digits are the setting coefficient for the in corner, and the last two digits are the setting coefficient for the outer corner.

The setting coefficient can be input in the range of 1 to 99.

The basic value is "5050".

\*2: If no data is input, control will be applied with "5050". (When TS value is input)

\*3: If the values in "RS1" and "ES1" are input, and RS2~6 and ES2~6 are blank, the control will be

applied with the value of "RS1" and "ES1".

\*4: The control is applied with the values which are set in the interval for blank items. The all items should

↑ In corner    ↑ Out corner  
Relation of setting coefficient and speed

|            | 1          | Setting coefficient | 99         |
|------------|------------|---------------------|------------|
| In corner  | Speed slow | ←→                  | Speed fast |
| Out corner | Speed slow | ←→                  | Speed fast |

In respect to the in corner, the speed should be slow to avoid contact and to correct the shape. Thus, generally a small value is set. It is also common to set a small value in the same manner

5°~1°

In respect to the out corner, the speed should be increased to correct the shape. Thus, a large value is generally set. If the corner R is small, the value may be set smaller in some cases.

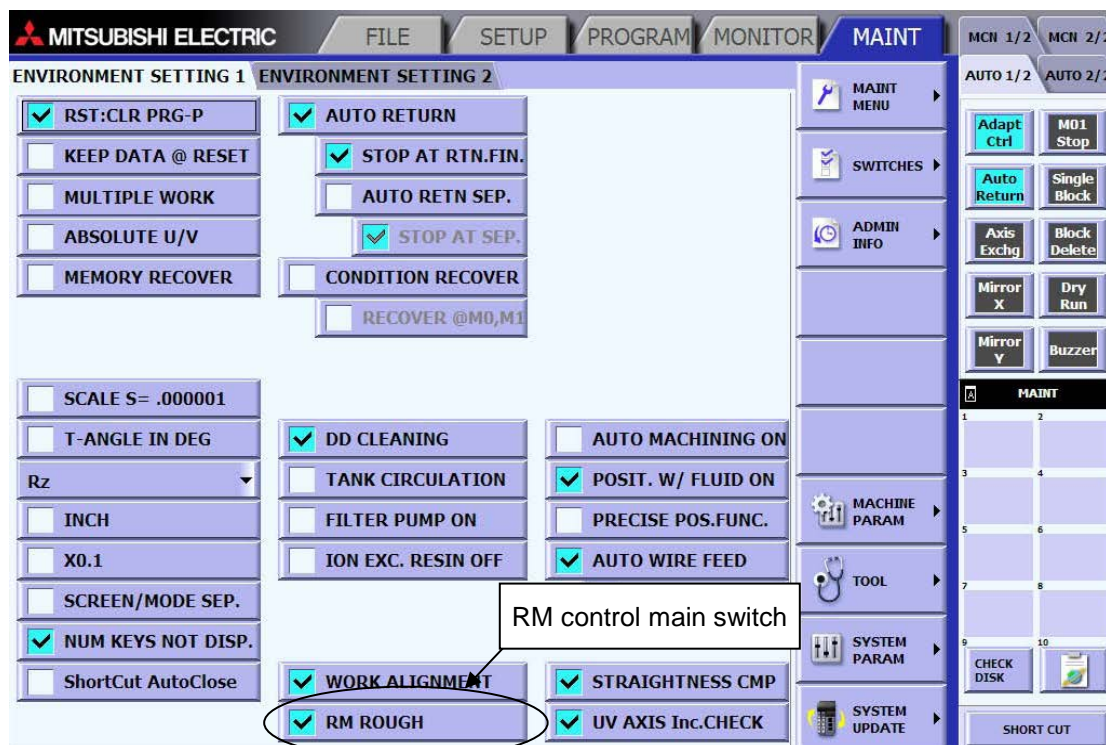

### 3-3 Machining with RM control

"RM" (rough master) is a control function that attempts to prevent corner breakages occurring in rough machining.

\*The RM switch is constantly kept ON.

#### [Usage Methods]

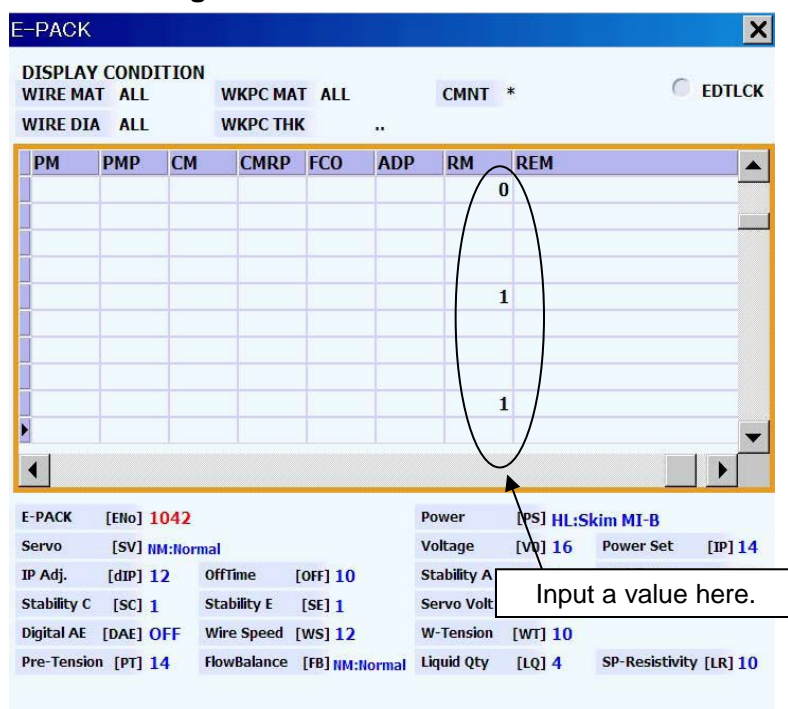

#### Maintenance Screen

ON/OFF can be set for the infometer "RM" in the E-Pack. (Default setting is set to ON.)

**Caution:** If the switch is OFF on the maintenance screen, the function will not work even if the switch is set to ON inside the E-Pack.

#### Screen listing E-Pack

Rough master OFF: 0 (will switch to OFF if left blank or a number 2 or above is entered)

Rough master ON: 1

### 3-4 Machining with EM Control

The EM function reduces the minute concave ("dimple") that occurs at the point (approach point) that connects the machining start hole and approach machining path during die shape machining.

#### (1) Types of EM functions

The EM function includes the EM-condition control and EM-path control. With the EM-condition control, the machining energy is controlled near the approach point. This function can be turned ON/OFF during machining. With EM-path control, the wire electrode path is changed near the approach point. This function must be turned ON or OFF before machining is started. Normally use the EM-condition control.

#### (2) EM setting methods

##### 1) To use EM-condition control

Open the "Process Control" screen from the "Automatic 2nd cut" screen or "MONITOR" screen, and turn the EM-condition control switch ON. This setting cannot be changed during machining, so always set it before starting. Normally, the EM adjustment bar should be set to 0.

##### 2) To use EM-path control

Open the "Process Control" screen from the "Automatic 2nd cut" screen or "MONITOR" screen, and turn the EM-condition control switch ON. Also set the path variation amount. This setting cannot be changed during machining and must be set before starting.

#### (3) Finely adjusting the approach point shape

The machining shape at the approach point can be finely adjusted with the following method.

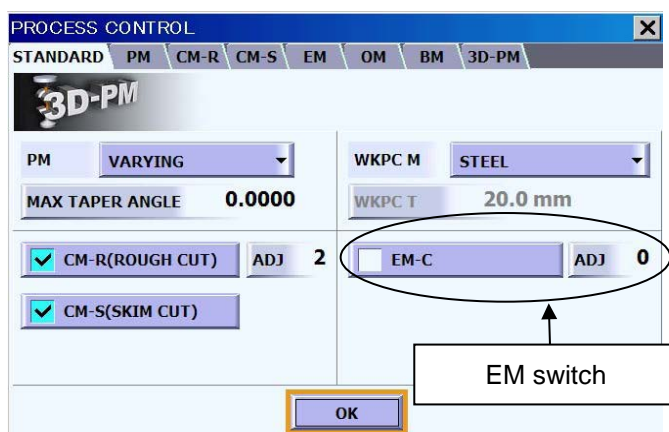

##### 1) To use EM-condition control

When the EM adjustment bar on the "Process Control" screen is set to the + side, the shape will become more convex, and when set to the - side, the shape will become more concave.

##### 2) To use EM-path control

Of the path variation amounts set on the "Process Control" screen, if the width is set larger, the control will be applied on a wide range. If the height is set larger, a stronger control will be applied. Refer to "Chapter 6 Program EM-Orbit control" in the Instruction Manual for details.

**Process Control (Standard screen)**

**Process Control (Detail screen)**

#### NOTE

- 1) When machining a shape other than a die shape, such as a punch shape or automatic coreless machining, set the EM-condition control switch and EM-path control switch OFF.
- 2) The EM-condition control is applied in the finishing conditions.
- 3) The EM function is applied only during the offset mode.

### 3-5 Machining with OM control

OM control reduces the shape dimension error at the arc section and linear section by controlling the machining amount when machining an arc.

#### (1) Setting OM

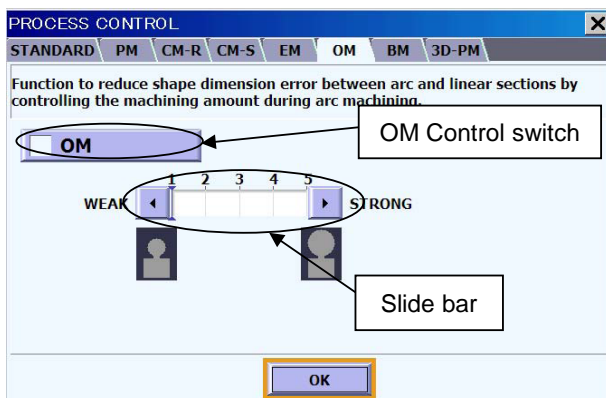

Open the "Process Control" screen from the "Automatic 2nd cut" screen or "MONITOR" screen, and turn the OM switch ON.

#### (2) Finely adjusting the OM control

OM control can be finely adjusted with the following method.

When the OM adjustment bar on the "Process Control" screen is set to a larger value (1 to 5), the machining amount during arc machining will decrease. When set to a smaller value, the machining amount during arc machining will increase.

#### Process Control (Detail screen)

### 3-6 Machining with BM control

BM control is a function that suppresses the "notches" and "cracks" that form when machining "CBN" or "PCD" material, etc. Control is applied on all movement blocks based on the parameters set on the BM CONTROL CONDITION SETTING screen. This control is applied only in the following cases.

- When the "BM CONTROL" switch is ON
- When the ADAPTIVE CONTROL SYSTEM (\*1) switch is OFF
- In the Automatic 2nd cut mode (\*2) with the condition search "INCOMPLETE"

\*1 Adaptive control refers to PM, CM-R, CM-S, EM and OM.

\*2 To cancel the Automatic 2nd cut mode, search for a program other than L9000 on the MONITOR screen.

\*3 Does not function when offset is applied.

#### (1) Setting BM control

BM control is set by opening the "PARAMETER SETTINGS" on the "Automatic 2nd cut" screen or "MONITOR" screen.

Refer to the "NC Operation and Display Screen Section" for details on setting the BM control condition settings.

- 1) Turn ON the "BM Control" switch on the "PROCESS CONTROL" screen.
- 2) Set the machining condition (Ea) used at the head of one block, and the distance (La) for using that condition.
- 3) Set the machining condition (Eb) used at the end of one block, and the distance (Lb) for using that condition.  
(On the Automatic 2nd cut screen, these setting areas are located below the "BM Control")
- 4) Confirm that the adaptive control system switch, for PM, CM-R, etc., is OFF.
- 5) When the program is started, BM control will be applied on all movement blocks.

#### Process Control (Detail screen)

The screenshot shows the "PROCESS CONTROL" window with tabs for STANDARD, PM, CM-R, CM-S, EM, OM, BM, and 3D-PM. The BM tab is selected. Below the tabs, a text box explains the function: "Function to suppress 'chips' and 'cracks' that appear while machining 'CBN', 'PCD', or other material." A "BM CONTROL" switch is shown, which is currently off. A diagram illustrates the "1 BLOCK" machining process, divided into "PRE SECTION" and "POST SECTION". Below the diagram, there are input fields for "Pre:LENGTH" (0.000), "Post:LENGTH" (0.000), "Pre:E No." (0), and "Post:E No." (0). An "OK" button is at the bottom.

| Pre:LENGTH | 0.000 | Post:LENGTH | 0.000 |
|------------|-------|-------------|-------|
| Pre:E No.  | 0     | Post:E No.  | 0     |

## NOTE

- \*1 The "BM Control" switch and BM control conditions cannot be changed while the program is running.
- \*2 When the BM control switch is turned ON, "BM unavailable" will appear if there are settings which cannot be set with BM control (refer to "3-4-6 (1) What is BM Control?".)
- BM unavailable**
- \*3 When machining with BM control, do not turn the ADAPTIVE CONTROL SYSTEM switch ON with the screen or NC program while the program is running.
- \*4 Conditions (distance, machining conditions) that do not form "notches" or "cracks" differ according to the workpiece material and shape. Create the appropriate values and machining conditions, and set them on the BM CONDITION SETTING screen.
- \*5 For Ea and Eb, input the machining condition NO. registered in the control unit. BM control will not function if an unregistered number is set.
- \*6 If an E No. is designated when using machining ON control during return to wire break point, The E conditions designated with the machining ON control will be applied while returning to the wire break point. BM control is applied after returning to the wire break point.
- \*7 The following operations will take place if an axis magnification or figure magnification is set.

|                      | Setting example                | Operation example   |
|----------------------|--------------------------------|---|
| Each axis scale      | When 2.000 is input for X axis | BM control will be applied with a double distance for the X axis at the pre-interval and post-interval.                             |
| Figure magnification | When 2.000 is input            | BM control is applied with the set value for the pre-interval and post-interval without being affected by the figure magnification. |

- \*8 The BM control estimate cannot be viewed on the ESTIMATE RESULTS screen.
- \*9 Changing the machining condition No. or notch from MONITOR screen during BM control  
The changed conditions are valid only in the changed interval. The conditions set on the BM CONTROL screen are applied when the movement shifts to the next interval or next block. To change the conditions in each interval, change the current conditions as well as the corresponding machining condition notch on the MACHINING CONDITION screen.

## 4. Optimizing Machining Conditions

### 4-1 1st Cut Machining Section

(Problem)

(Countermeasures)

Frequent wire breakage during 1st cut

- 1) Lower IP by 1 notch.
- 2) Raise VG by 3 to 5 notches.
- 3) Raise SB by 1 to 3 notches.

Frequent short circuit during 1st cut

- 1) Raise VG by 2 to 8 notches.
- 2) Raise SE by 1 notch.

Machining speed is slow during 1st cut

- 1) Lower SB by 1 to 3 notches.
- 2) Lower VG by 2 to 5 notches.
- 3) Raise IP by 1 notch.

Wire breaks in collection pipe

- 1) Lower WT by 1 to 2 notches.
- 2) Confirm that the lower roller rotates smoothly.

Changing of 1st cut conditions according to machining material and setup conditions

When machining SKD-11, 40t with  $\phi 0.2$  wire

Note) This table is a guideline.

| Machining material         | Quenched SKD-11 | Raw SKD-11 | NAK/HPM | SK-3/S45C | Stainless steel | Aluminum | Copper | Copper tungsten | Graphite |
|----------------------------|-----------------|------------|---------|-----------|-----------------|----------|--------|-----------------|----------|
| Voltage open Vo (Notch)    | 7               |            |         |           |                 |          |        |                 | +4       |
| Power setting IP (Notch)   | 9               |            |         | -1        |                 | -1       | -1     | -1              | -2       |
| Off time OFF (Notch)       | 3               |            |         |           |                 |          |        |                 |          |
| Stabilizer A SA (Notch)    | 5               |            |         |           |                 |          |        | -1              | -2       |
| Stabilizer B SB (Notch)    | 4               | +2         | +2      | +2        | +2              | +2       |        |                 | +4       |
| Stabilizer E SE (Notch)    | 4               |            |         |           |                 |          |        |                 |          |
| Wire tension WT (Notch)    | 8               |            |         |           |                 |          |        |                 | -1       |

| Wire tension WT (Notch)    | 8        |                        |                        |                        |                   | -1           | -1           | -2            | -3            |
| Voltage gap VG (V)         | 50       |                        |                        |                        | +4                |              | +5           | +5            | +10           |
| Actual machining speed (%) | 100      | 80                     | 80                     | 60                     | 60                | 90           | 85           | 70            | 50            |

Note) Wire breakage can be reduced by raising the SE notch from 1 → 2 → 3 → 4 → 5.

## 4-2 Finish Machining Section

### Improvement of machining accuracy (For punch shape)

#### (Problem)

Center is concave

- 1) Raise 2nd machining speed

#### (Countermeasures)

[When SV notch is set to NM]

- Lower 2nd VG by 2 to 5 notches
- Lower 2nd SB by 1 to 2 notches

[When SV notch is set to SL]

- Raise FA by 0.5 to 1.0

Shape is concave and  
there is a difference in  
upper/lower dimensions

- 1) Raise 2nd machining speed
- 2) Raise wire feedrate

- Same as above
- Raise WS by 2 to 4 notches

There is a difference in  
upper/lower dimensions

- 1) Raise wire feedrate
- 2) Increase step increment between  
1st and 2nd

- Raise WS by 2 to 4 notches
- Increase the approach amount  
by 2 to 7  $\mu\text{m}$

Bullet shaped and  
there is a difference in  
upper/lower  
dimensions

- 1) Decrease step increment between  
1st and 2nd

- Decrease the approach amount  
by 2 to 10  $\mu\text{m}$

Center is swollen

- 1) Lower 2nd machining speed

[When SV notch is set to NM]

- Raise 2nd VG by 2 to 5 notches
- Raise 2nd SB by 1 to 2 notches

[When SV notch is set to SL]

- Lower FA by 0.5 to 1.0

### When lines are formed on machining surface

#### When short circuit occurs

- (1) Decrease step increment between IP: 4 and IP:3 by 1 to 5  $\mu\text{m}$
- (2) Raise IP: 4 VG by 1 to 5 notches
- (3) Raise IP: 3 Vo by 2 to 6 notches

When the SV notch is set to NM, raise VG by 10 to 20 V.

When the SV notch is set to SL, lower FA by 1.0 to 2.0.

- During thick plate (60mm or more) machining with the upper/lower nozzles separated, increase LQ for the 2nd and following cuts by 1 to 2 notches.  
(To prevent short circuits and speed drops at IP: 3 or less.)

### **4-3 Nozzle Separated Machining Section**

When sampling the machining conditions, the upper and lower nozzle gap is set with the values given in the machining conditions table. If the nozzle is separated by more than those values, refer to the following countermeasure and change the conditions.

#### **For 1st cut**

If the nozzle is separated from the workpiece during 1st cut, the dielectric fluid will not be applied suitably resulting in wire breakages or short circuits. Thus, PM should be used when the nozzle is separated. Change the conditions as shown below when using the standard conditions.

| (Problem)                                | (Countermeasures)  |
|--|--|
| 1) Wire breaks frequently during 1st cut | 1) Lower IP by 1 notch<br>2) Increase VG by 3 to 5 notches<br>3) Increase SB by 1 to 3 notches |
| 2) Short-circuits occur during 1st cut   | 1) Increase VG by 2 to 8 notches<br>2) Increase SE by 1 notch                                  |

#### **For finish machining**

During finish machining, if the nozzle is separated, the reactionary force of the electrical discharge will cause the wire to separate from the workpiece easily and cause the machining speed to increase. When this occurs, the finish dimensions could increase, the shape bulge at the middle, and a short-circuit could occur when finishing.

| (Problem)   | (Countermeasures)  |
|---|--|
| 1) The finish dimension is large                  | 1) Shift the offset by the error amount on one side  |
| 2) The shape is bulging or a short-circuit occurs | 1) Adjust VG so that the machining speed is the same as the speed given in the machining conditions table (Increase VG by 2 to 10 notches) |

## 4-4 Correcting the Upper/lower Dimension Difference

If the upper/lower dimension difference cannot be corrected with the method explained in section 4-2, correct by using the straightness compensation function.

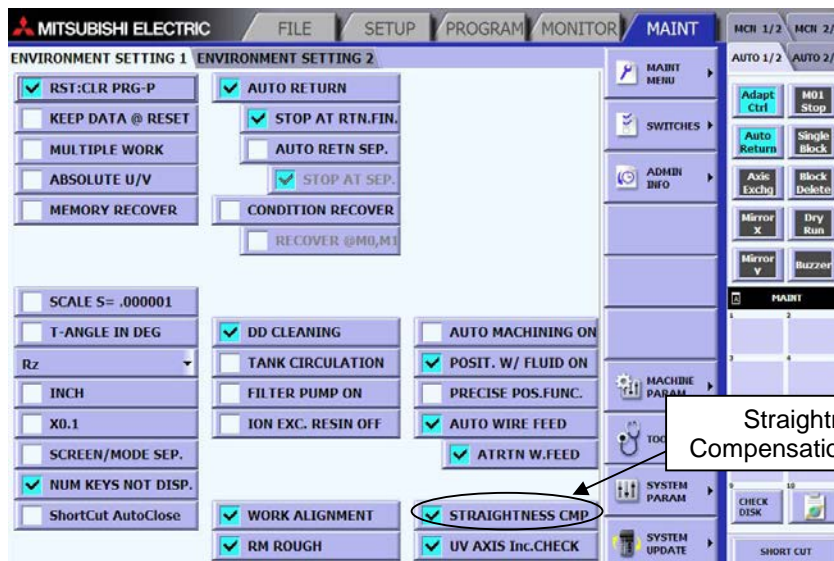

The straightness compensation function automatically carries out a small amount of taper machining using simple settings.

\* **Straightness compensation is usually ON.**

### **CAUTION!!**

1) The straightness compensation will not function during taper machining or upper/lower random shape machining.

### Maintenance screen

### 4-4-1 Executing the straightness compensation function

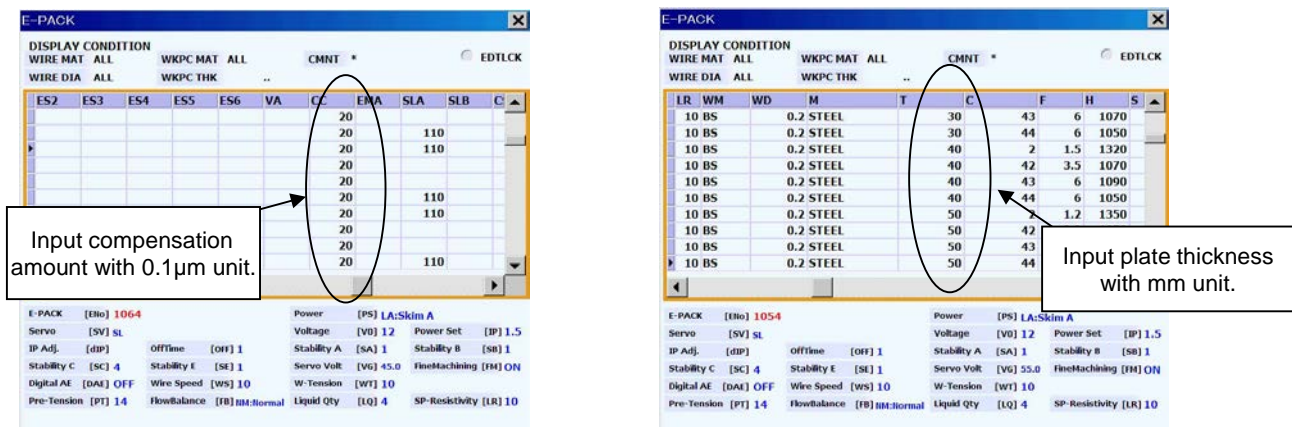

The following settings must be made to correctly use the straightness compensation function.

- 1) The STRAIGHTNESS COMPENSATION switch must be checked. (See above diagram.)
- 2) The compensation data must be input in infometer "CC" of the machining conditions to be used.
- 3) The workpiece thickness data must be input in infometer "T" of the machining conditions to be used.
- 4) Taper indexing must be completed.
- 5) Z1 and Z5 must be set with the PROGRAM or TAPER INDEXING screen.
- 6) The offset command (G41 or G42) must be issued in the program.

If the above settings have been made, the straightness compensation will be applied automatically when machining is started.

When the straightness compensation function is activated, the U or V axis will operate during machining. Operation of the straightness compensation function can be confirmed with the movement of the UV axes.

### Screen listing E-Pack

\*The input method is the same for the 0.1 μm mode.

#### 4-4-2 Setting the infometer

Infometer "T" : Input the workpiece thickness.

Infometer "CC" : Input the compensation amount (one-side) as a value multiplied by 10.

For example, if the machining results are as shown below when machining a 60mm punch shape, input the following:

Infometer "T" : 60

Infometer "CC" : 10

#### Calculating infometer "CC"

- 1) Calculate the upper/lower dimension difference (both sides).
- 2) Calculate the upper/lower dimension difference (one-side).
- 3) Multiple the value by 10.

Example (For shape shown on left)

A=9.998mm

B=10.000mm

- 1) ...  $10.000 - 9.998 = 0.002$  mm  
The upper/lower dimension difference (both sides) is 2  $\mu\text{m}$ .
- 2) ...  $2 \div 2 = 1$   
The upper/lower dimension difference (one-side) is 1  $\mu\text{m}$ .
- 3) ...  $1 \times 10 = 10$   
The infometer "CC" value is "10".

\* The infometer "CC" value may be a minus value when machining a die shape.

#### 4-4-3 Setting Z1 and Z5

#### Setting Z1 and Z5

Designate the Z1 and Z5 positions as shown on the left.

Z1 (program dimension height)

... top of workpiece

Z5 (random shape designation height)

... bottom of workpiece

If the workpiece is directly placed on the table, input as follows:

Z1=60.

Z5=0.

Refer to Chapter 2 Basic Operations, Taper Machining in the Instruction Manual for details on taper indexing.

#### **NOTE**

Input the CC data for all conditions from rough machining to final finishing.

**5-1 ø0.20 Wire**  
**Machining Characteristics Data**
